

Invisible profile RJF

RJF is a patented aluminum profile with a minimal section conceived for detailing external corner joints. Resulting in a practically invisible corner detail, the profile is perfect for prestigious design applications. The tile edge must be mitered at 45° angle to sit flush against the profile.

Profilitec is expanding its RJF range, introducing a profile for 3 mm surface coverings. We are also adding a 12,5 mm profile and a 20 mm one which can be used for outdoor stair nosing.

RJF's advantage is an invisible design detail, with a wide selection of resistant materials that perfectly match any wall or floor covering.
